CHAPTER – 1
REAL NUMBERS

EUCLID’S DIVISION LEMMA
Given positive integers \(a\) and \(b\), there exist unique integers \(q\) and \(r\) satisfying \(a = bq + r\), where \(0 \leq r < b\).

Here we call ‘\(a\)’ as dividend, ‘\(b\)’ as divisor, ‘\(q\)’ as quotient and ‘\(r\)’ as remainder.

\[\therefore \text{ Dividend} = (\text{Divisor} \times \text{Quotient}) + \text{Remainder} \]

If in Euclid’s lemma \(r = 0\) then \(b\) would be HCF of ‘\(a\)’ and ‘\(b\)’.

EUCLID’S DIVISION ALGORITHM

Euclid’s division algorithm is a technique to compute the Highest Common Factor (HCF) of two given positive integers. Recall that the HCF of two positive integers \( a \) and \( b \) is the largest positive integer \( d \) that divides both \( a \) and \( b \).

To obtain the HCF of two positive integers, say \( c \) and \( d \), with \( c > d \), follow the steps below:

Step 1 : Apply Euclid’s division lemma, to \( c \) and \( d \). So, we find whole numbers, \( q \) and \( r \) such that \( c = dq + r \), \( 0 \leq r < d \).
Step 2 : If \( r = 0 \), \( d \) is the HCF of \( c \) and \( d \). If \( r \neq 0 \) apply the division lemma to \( d \) and \( r \).
Step 3 : Continue the process till the remainder is zero. The divisor at this stage will be the required HCF.

This algorithm works because \( \text{HCF} (c, d) = \text{HCF} (d, r) \) where the symbol \( \text{HCF} (c, d) \) denotes the HCF of \( c \) and \( d \), etc.

IMPORTANT QUESTIONS

Use Euclid’s division algorithm to find the HCF of 867 and 255

Solution: Since 867 > 255, we apply the division lemma to 867 and 255 to obtain
\[ 867 = 255 \times 3 + 102 \]
Since remainder \( 102 \neq 0 \), we apply the division lemma to 255 and 102 to obtain
\[ 255 = 102 \times 2 + 51 \]
We consider the new divisor 102 and new remainder 51, and apply the division lemma to obtain
\[ 102 = 51 \times 2 + 0 \]
Since the remainder is zero, the process stops.
Since the divisor at this stage is 51,
Therefore, HCF of 867 and 255 is 51.

13. If the HCF of 408 and 1032 is expressible in the form of \( 1032m - 408x \), find \( m \).
The Fundamental Theorem of Arithmetic
Every composite number can be expressed (factorised) as a product of primes, and this factorisation is unique, apart from the order in which the prime factors occur.

The prime factorisation of a natural number is unique, except for the order of its factors.

- Property of HCF and LCM of two positive integers ‘a’ and ‘b’:
  - \( HCF(a, b) \times LCM(a, b) = a \times b \)
  - \( LCM(a, b) = \frac{a \times b}{HCF(a, b)} \)
  - \( HCF(a, b) = \frac{a \times b}{LCM(a, b)} \)

PRIME FACTORIZATION METHOD TO FIND HCF AND LCM
HCF(a, b) = Product of the smallest power of each common prime factor in the numbers.
LCM(a, b) = Product of the greatest power of each prime factor, involved in the numbers.

**IMPORTANT QUESTIONS**

Find the LCM and HCF of \(510\) and \(92\) and verify that LCM \(\times\) HCF = product of the two numbers

**Solution:**
- \(510 = 2 \times 3 \times 5 \times 17\)
- \(92 = 2 \times 2 \times 23 = 2^2 \times 23\)
- \(HCF = 2\)
- \(LCM = 2^2 \times 3 \times 5 \times 17 \times 23 = 23460\)
- Product of two numbers = \(510 \times 92 = 46920\)
- HCF \(\times\) LCM = \(2 \times 23460 = 46920\)
- Hence, product of two numbers = HCF \(\times\) LCM

16. The length, breadth and height of a room are 825 cm, 675 cm and 450 cm respectively. Find the longest tape which can measure the three dimensions of the room exactly.

**IRRATIONALITY OF NUMBERS**

**IMPORTANT QUESTIONS**

**Prove that \( \sqrt{5} \) is an irrational number.**

**Solution:** Let \( \sqrt{5} \) is a rational number then we have

\[ \sqrt{5} = \frac{p}{q} \]

where \( p \) and \( q \) are co-primes.

\[ \Rightarrow p = \sqrt{5}q \]

Squaring both sides, we get

\[ p^2 = 5q^2 \]

\[ \Rightarrow p^2 \text{ is divisible by 5} \]

\[ \Rightarrow p \text{ is also divisible by 5} \]

So, assume \( p = 5m \) where \( m \) is any integer.

Squaring both sides, we get \( p^2 = 25m^2 \)

But \( p^2 = 5q^2 \)

Therefore, \( 5q^2 = 25m^2 \)

\[ \Rightarrow q^2 = 5m^2 \]

\[ \Rightarrow q^2 \text{ is divisible by 5} \]

\[ \Rightarrow q \text{ is also divisible by 5} \]

From above we conclude that \( p \) and \( q \) has one common factor i.e. 5 which contradicts that \( p \) and \( q \) are co-primes.

Therefore our assumption is wrong.

Hence, \( \sqrt{5} \) is an irrational number.

**Questions for practice**

1. Prove that \( \sqrt{2} \) is an irrational number.

2. Prove that \( \sqrt{3} \) is an irrational number.

3. Prove that \( 2 + 5\sqrt{3} \) is an irrational number.

4. Prove that \( 3 - 2\sqrt{5} \) is an irrational number.

5. Prove that \( \sqrt{2} + \sqrt{3} \) is an irrational number.

6. Prove that \( \sqrt{3} + \sqrt{5} \) is an irrational number.

**RATIONAL NUMBERS AND THEIR DECIMAL EXPANSIONS**

Let \( x = \frac{p}{q} \) be a rational number, such that the prime factorisation of \( q \) is of the form \( 2^m.5^n \), where \( m, n \) are non-negative integers. Then \( x \) has a decimal expansion which terminates.

Let \( x = \frac{p}{q} \) be a rational number, such that the prime factorisation of \( q \) is not of the form \( 2^m.5^n \), where \( m, n \) are non-negative integers. Then \( x \) has a decimal expansion which is non-terminating repeating (recurring).
**IMPORTANT QUESTIONS**

Without actually performing the long division, state whether the rational numbers \( \frac{987}{10500} \) will have a terminating decimal expansion or a non-terminating repeating decimal expansion:

**Solution:** Given rational number \( \frac{987}{10500} \) is not in the simplest form. Dividing numerator and denominator by 21 we get \( \frac{987}{1050} = \frac{987 \div 21}{1050 \div 21} = \frac{47}{50} \) which is in the form of \( \frac{p}{q} \). Now q = 500 = \( 2^2 \times 5^3 \) which is in the form of \( 2^m \cdot 5^n \), where m, n are non-negative integers. Therefore the given rational number has terminating decimal expansion.

**Questions for practice**

Without actually performing the long division, state whether the following rational numbers will have a terminating decimal expansion or a non-terminating repeating decimal expansion:

(i) \( \frac{13}{3125} \) (ii) \( \frac{129}{2^5 \cdot 7^5} \) (iii) \( \frac{77}{210} \) (iv) \( \frac{1457}{1250} \) (v) \( \frac{833}{2^5 \cdot 5^7} \)

POLYNOMIALS

QUADRATIC POLYNOMIAL
Relationship between zeroes and coefficients
General form of Quadratic polynomial: \( ax^2 + bx + c, a \neq 0 \)

Sum of zeroes \( (\alpha + \beta) = -\frac{\text{Coefficient of } x}{\text{Coefficient of } x^2} = -\frac{b}{a} \)

Product of zeroes \( (\alpha \beta) = \frac{\text{Constant term}}{\text{Coefficient of } x^2} = \frac{c}{a} \)

IMPORTANT QUESTIONS

Find a quadratic polynomial, the sum and product of whose zeroes are \(-3\) and \(2\), respectively.
Solution: Here, \( \alpha + \beta = -3 \) and \( \alpha \beta = 2 \)
We know that quadratic polynomial is given by \( p(x) = x^2 - (\alpha + \beta)x + \alpha \beta \)

\[
x^2 - (-3)x + 2 = x^2 + 3x + 2
\]
Hence, required quadratic polynomial is \( x^2 + 3x + 2 \)

Find a quadratic polynomial, whose zeroes are \(-3\) and \(2\).
Solution: Here, \( \alpha = -3 \) and \( \beta = 2 \).
Now, \( \alpha + \beta = -3 + 2 = -1 \) and \( \alpha \beta = (-3)(2) = -6 \)
We know that quadratic polynomial is given by \( p(x) = x^2 - (\alpha + \beta)x + \alpha \beta \)

\[
x^2 - (-1)x + (-6) = x^2 + x - 6
\]
Hence, required quadratic polynomial is \( x^2 + x - 6 \)

Find the zeroes of the quadratic polynomial \( x^2 - 2x - 8 \) and verify the relationship between the zeroes and the coefficients.
Solution: Here, \( p(x) = x^2 - 2x - 8 = 0 \)

\[
x^2 - 4x + 2x - 8 = 0 \Rightarrow x(x - 4) + 2(x - 4) = 0 \Rightarrow (x - 4)(x + 2) = 0
\]
\( \Rightarrow x = 4, -2 \)
Now, \( a = 1, b = -2, c = -8, \alpha = 4, \beta = -2 \)

Sum of zeroes, \( \alpha + \beta = 4 + (-2) = 2 \) and \( \frac{-b}{a} = \frac{-(-2)}{1} = 2 \) \( \therefore \alpha + \beta = \frac{-b}{a} \)

Product of zeroes, \( \alpha \beta = 4(-2) = -8 \) and \( \frac{c}{a} = \frac{-8}{1} = -8 \) \( \therefore \alpha \beta = \frac{c}{a} \)
Hence verified.

DIVISION ALGORITHM FOR POLYNOMIALS

If $p(x)$ and $g(x)$ are any two polynomials with $g(x) \neq 0$, then we can find polynomials $q(x)$ and $r(x)$ such that $p(x) = g(x) \times q(x) + r(x)$, where $r(x) = 0$ or degree of $r(x) <$ degree of $g(x)$.

★ If $r(x) = 0$, then $g(x)$ is a factor of $p(x)$.

★ Dividend = Divisor $\times$ Quotient $+$ Remainder

Prepared by: M. S. KumarSwamy, TGT(Maths)
IMPORTANT QUESTIONS

Divide $3x^2 - x^3 - 3x + 5$ by $x - 1 - x^2$, and verify the division algorithm.

Solution:

\[
\begin{array}{c|ccccc}
 & x^2 & + & 1 & \\
\hline
\frac{x^2 + x - 1}{-x^3 + 3x^2 - 3x + 5} & -x^2 & - & x & + \\
\hline & 2x^2 & - & 2x & + & 5 \\
& - & + & - & + & - \\
\hline & 2x^2 & - & 2x & + & 2 \cdot \frac{3}{3}
\end{array}
\]

So, quotient $= x - 2$, remainder $= 3$.

Now, $\text{Divisor} \times \text{Quotient} + \text{Remainder} = (x^2 - 1) (x - 2) + 3$

$= -x^3 + x^2 - x + 2x^2 - 2x + 2 + 3$

$= -x^3 + 3x^2 - 3x + 5$

= Dividend

CHAPTER – 5
ARITHMETIC PROGRESSION

nth Term of an ARITHMETIC PROGRESSION (AP)
nth term \(a_n\) of the AP with first term \(a\) and common difference \(d\) is given by

\[ a_n = a + (n - 1) d. \]

IMPORTANT QUESTIONS

Find the 15th term of the 21, 24, 27, . . .
Solution: Here, \(a = 21, d = 24 - 21 = 3\)
We know that \(a_n = a + (n - 1)d\)
So, \(a_{15} = a + 14d = 21 + 14(3) = 21 + 42 = 63\)

Which term of the AP : 3, 9, 15, 21, . . . , is 99?
Solution: Here, \(a = 3, d = 9 - 3 = 6\)
We know that \(a_n = a + (n - 1)d\)
Let \(a_n = 99\)
\[3 + (n - 1)6 = 99 \Rightarrow (n - 1)6 = 99 - 3 = 96\]
\[n - 1 = \frac{96}{6} = 16 \Rightarrow n = 16 + 1 = 17\]
Hence, 17th term of the given AP is 99

Determine the AP whose 3rd term is 5 and the 7th term is 9.
Solution: We have \(a_3 = a + (3 - 1)d = a + 2d = 5 \quad \text{............ (1)}\)
and \(a_7 = a + (7 - 1)d = a + 6d = 9 \quad \text{................. (2)}\)
Solving the pair of linear equations (1) and (2), we get \(a = 3, d = 1\)
Hence, the required AP is 3, 4, 5, 6, 7, . . .

**n**th Term from the end of an ARITHMETIC PROGRESSION (AP)

Let the last term of an AP be ‘\(l\)’ and the common difference of an AP is ‘\(d\)’ then the \(n\)th term from the end of an AP is given by

or

\[ S_n = \frac{n}{2} [a + l] \]

where \(l = \text{last term}\)
IMPORTANT QUESTIONS

Find the sum of the first 22 terms of the AP: 8, 3, –2, . . .

Solution: Here, \(a = 8, d = 3 – 8 = –5, n = 22.\)

We know that \(S_n = \frac{n}{2}[2a + (n – 1)d]\)

\(\therefore S = \frac{22}{2}[16 + (22 – 1)\times(–5)] = 11(16 – 105) = 11(–89) = –979\)

IMPORTANT THEOREMS
BASIC PROPORTIONALITY THEOREM OR THALES THEOREM
If a straight line is drawn parallel to one side of a triangle intersecting the other two sides, then it divides the two sides in the same ratio.

GIVEN: A \( \Delta ABC \) and line ‘l’ parallel to BC intersect \( AB \) at \( D \) and \( AC \) at \( E \).

TO PROVE:
\[
\frac{AD}{DB} = \frac{AE}{EC}
\]

CONSTRUCTION: Join \( BE \) and \( CD \). Draw \( EL \perp AB \) and \( DM \perp AC \).

PROOF: We know that areas of the triangles on the same base and between same parallel lines are equal, hence we have:

\[
\text{area (}\Delta BDE\text{)} = \text{area (}\Delta CDE\text{)}
\]

...(i)

Now, we have

\[
\frac{\text{Area of } \Delta ADE}{\text{Area of } \Delta BDE} = \frac{\frac{1}{2} \times AD \times EL}{\frac{1}{2} \times DB \times EL} = \frac{AD}{DB}
\]

...(ii)

Again, we have

\[
\frac{\text{Area of } \Delta ADE}{\text{Area of } \Delta CDE} = \frac{\frac{1}{2} \times AE \times DM}{\frac{1}{2} \times EC \times DM} = \frac{AE}{EC}
\]

...(iii)

Put value form (i) in (ii), we have

\[
\frac{\text{Area of } \Delta ADE}{\text{Area of } \Delta CDE} = \frac{AD}{DB}
\]

...(iv)

On comparing equation (ii) and (iii), we get

\[
\frac{AD}{DB} = \frac{AE}{EC}
\]

Hence Proved.

COROLLARY:

(i) \( \frac{AB}{DB} = \frac{AC}{EC} \)

(ii) \( \frac{DB}{AD} = \frac{EC}{AE} \)

(iii) \( \frac{AB}{AD} = \frac{AC}{AE} \)

(iv) \( \frac{DB}{AB} = \frac{EC}{AC} \)

(v) \( \frac{AD}{AB} = \frac{AE}{AC} \)
CONVERSE OF BASIC PROPORTIONALITY THEOREM
(CONVERSE OF THALES THEOREM)
If a straight line divides any two sides of a triangle in the same ratio, then the line must be parallel to the third side.

GIVEN: A \( \triangle ABC \) and line \( l \) intersecting the sides \( AB \) at \( D \) and \( AC \) at \( E \) such that:

\[
\frac{AD}{DB} = \frac{AE}{EC}
\]

TO PROVE: \( l \parallel BC \).

PROOF: Let us suppose that the line \( l \) is not parallel to \( BC \).
Then through \( D \), there must be any other line which must be parallel to \( BC \).
Let \( DF \parallel BC \), such that \( E \neq F \).

Since,
\[
\frac{DF}{BC} \quad \text{(by supposition)}
\]

\[
\frac{AD}{DB} = \frac{AF}{FC} \quad \ldots(i) \quad \text{(Basic Proportionality Theorem)}
\]

\[
\frac{AD}{DB} = \frac{AE}{EC} \quad \ldots(ii) \quad \text{(Given)}
\]

Comparing (i) and (ii), we get
\[
\frac{AF}{FC} = \frac{AE}{EC}
\]

Adding 1 to both sides, we get
\[
\frac{AF + FC}{FC} = \frac{AE + EC}{EC}
\]

\[
\frac{AC}{FC} = \frac{AC}{EC}
\]

\[
\frac{1}{FC} = \frac{1}{EC}
\]

\[
FC = EC
\]

This shows that \( E \) and \( F \) must coincide, but it contradicts our supposition that \( E \neq F \) and \( DF \parallel BC \).
Hence, there is one and only line, \( DE \parallel BC \), i.e.

\[
[l \parallel BC]
\]

Hence Proved.

AREAS OF SIMILAR TRANGLES THEOREM
The ratio of the areas of two similar triangles is equal to the ratio of the squares of their corresponding sides.

GIVEN: \( \triangle ABC \sim \triangle DEF \)

TO PROVE:
\[
\frac{\text{Area of } (\triangle ABC)}{\text{Area of } (\triangle DEF)} = \frac{BC^2}{EF^2} = \frac{AB^2}{DE^2} = \frac{AC^2}{DF^2}
\]
CONSTRUCTION: Draw $AG \perp BC$ and $DH \perp EF$.

PROOF:

\[
\frac{\text{Area (}\triangle ABC)}{\text{Area (}\triangle DEF)} = \frac{\frac{1}{2} \times BC \times AG}{\frac{1}{2} \times EF \times DH} = \frac{BC}{EF} \cdot \frac{AG}{DH}
\]  

(area of $\triangle = \frac{1}{2} \times \text{base} \times \text{height}$)

Now in triangle $ABG$ and $DEH$, we have

\[
\angle B = \angle E \quad \text{(since, } \triangle ABC \sim \triangle DEF) \\
\angle AGB = \angle DHE \quad \text{(each 90°)}
\]

Therefore,

\[
\triangle ABG \sim \triangle DEH \quad \text{(by AA criterion)}
\]

Hence,

\[
\frac{AB}{DE} = \frac{AG}{DH} \quad \text{...(ii) (Using property of similar triangles)}
\]

\[
\Rightarrow \frac{AB}{DE} = \frac{BC}{EF} \quad \text{...(iii) (since, } \triangle ABC \sim \triangle DEF)\]

Comparing (ii) and (iii), we get

\[
\frac{AG}{DH} = \frac{BC}{EF} \quad \text{...(iv)}
\]

Using (i) and (iv), we get

\[
\frac{\text{Area (}\triangle ABC)}{\text{Area (}\triangle DEF)} = \frac{\frac{1}{2} \times BC \times AG}{\frac{1}{2} \times EF \times DH} = \frac{BC}{EF} \cdot \frac{AG}{DH} = \frac{BC}{EF} \cdot \frac{BC}{EF} = \frac{BC^2}{EF^2} \quad \text{...(v)}
\]

\[
\frac{BC}{EF} = \frac{AB}{DE} = \frac{AC}{DF} \quad \text{...(vi) (since, } \triangle ABC \sim \triangle DEF)\]

Using (v) and (vi), we get

\[
\begin{align*}
\text{Area of (}\triangle ABC) &= \frac{BC^2}{EF^2} \cdot \frac{AB^2}{DE^2} = \frac{AC^2}{DF^2} \\
\text{Area of (}\triangle DEF) &= \frac{BC^2}{EF^2} \cdot \frac{AD^2}{DE^2} = \frac{AC^2}{DF^2}
\end{align*}
\]

Hence Proved.

PYTHAGORAS THEOREM

In a right angled triangle, the square of the hypotenuse is equal to the sum of the squares of the other two sides.

GIVEN: $\triangle ABC$ is right angled at $B$.

TO PROVE: \[AC^2 = AB^2 + BC^2.\]

CONSTRUCTION: Draw $BD \perp AC$.

PROOF: Taking $\triangle ADB$ and $\triangle ABC$

\[
\angle B = \angle ADB \quad \text{(each 90°)}
\]

\[
\angle A = \angle A \quad \text{(common)}
\]

Therefore,

\[
\triangle ADB \sim \triangle ABC \quad \text{(by AA criterion)}
\]

Converse of Pythagoras theorem
In a triangle, if the square of one side is equal to the sum of the squares of the other two sides, then the angle opposite to the first side is a right angle.

**GIVEN:** \( AC^2 = AB^2 + BC^2 \) \( \ldots(i) \)

**TO PROVE:** \( \triangle ABC \) is right angled at \( B \).

**CONSTRUCTION:** Draw right \( \triangle PQR \) such that \( AB = PQ \), \( BC = QR \), and \( \angle Q = 90^\circ \).

**PROOF:** Using Pythagoras theorem in \( \triangle PQR \), we get

\[ PR^2 = PQ^2 + QR^2 \] \( \ldots(ii) \)

By construction,

\[ AB = PQ \]

\[ BC = QR \]

Substituting these values in (ii), we get

\[ PR^2 = AB^2 + BC^2 \] \( \ldots(iii) \)

Comparing (i) and (iii), we get

\[ AC^2 = PR^2 \]

\[ AC = PR \] \( \ldots(iv) \)

Hence Proved.
In $\triangle ABC$ and $\triangle PQR$

$AB = PQ$ \hspace{1cm} (by construction)

$BC = QR$ \hspace{1cm} (by construction)

$AC = PR$ \hspace{1cm} (proved above in (iv))

$\Rightarrow \quad \triangle ABC = \triangle PQR$ \hspace{1cm} (by SSS congruence rule)

$\Rightarrow \quad \angle B = \angle Q$ \hspace{1cm} (by cpct)

But \hspace{1cm} $\angle Q = 90^\circ$ \hspace{1cm} (by construction)

Hence, \hspace{1cm} $\angle B = 90^\circ$

$\triangle ABC$ is right angled at $B$.

Hence Proved.

IMPORTANT QUESTIONS

Show that the points (1, 7), (4, 2), (–1, –1) and (–4, 4) are the vertices of a square.
Solution: Let A(1, 7), B(4, 2), C(–1, –1) and D(–4, 4) be the given points.
\[ AB = \sqrt{(4-1)^2 + (2-7)^2} = \sqrt{9 + 25} = \sqrt{34} \]
\[ BC = \sqrt{(4+1)^2 + (2+1)^2} = \sqrt{25 + 9} = \sqrt{34} \]
\[ CD = \sqrt{(-1+4)^2 + (-1+4)^2} = \sqrt{9 + 25} = \sqrt{34} \]
\[ DA = \sqrt{(1+4)^2 + (7-4)^2} = \sqrt{25 + 9} = \sqrt{34} \]
\[ AC = \sqrt{(1+1)^2 + (7+1)^2} = \sqrt{4 + 64} = \sqrt{68} \]
\[ BD = \sqrt{(4+4)^2 + (2-4)^2} = \sqrt{64 + 4} = \sqrt{68} \]
Since, \( AB = BC = CD = DA \) and \( AC = BD \), all the four sides of the quadrilateral ABCD are equal and its diagonals AC and BD are also equal. Therefore, ABCD is a square.

Find a point on the y-axis which is equidistant from the points A(6, 5) and B(–4, 3).
Solution: We know that a point on the y-axis is of the form \((0, y)\). So, let the point P(0, y) be equidistant from A and B. Then \( AP^2 = BP^2 \)
\[ (6-0)^2 + (5-y)^2 = (-4-0)^2 + (3-y)^2 \]
\[ 36 + 25 + y^2 - 10y = 16 + 9 + y^2 - 6y \]
\[ 4y = 36 \Rightarrow y = 9 \]
So, the required point is \((0, 9)\).

\[
\left( \frac{m_2x_2 + m_1x_1}{m_1 + m_2}, \frac{m_2y_2 + m_1y_1}{m_1 + m_2} \right)

IMPORTANT QUESTIONS
Find the coordinates of the point which divides the line segment joining the points (4, −3) and (8, 5) in the ratio 3 : 1 internally.
Solution : Let P(x, y) be the required point.
Using the section formula,
\[
x = \frac{3(8) + 1(4)}{3 + 1} = 7, \quad y = \frac{3(5) + 1(−3)}{3 + 1} = 3
\]
Therefore, (7, 3) is the required point.

In what ratio does the point (−4, 6) divide the line segment joining the points A(−6, 10) and B(3, −8)?
Solution : Let (−4, 6) divide AB internally in the ratio k : 1.
Using the section formula,
\[
y = \frac{k(−8) + 1(10)}{k + 1} = 6
\]
\[\Rightarrow −8k + 10 = 6k + 6 \Rightarrow −8k − 6k = 6 − 10 \]
\[\Rightarrow −14k = −4 \Rightarrow k = \frac{4}{14} = \frac{2}{7}
\]
Therefore, the point (−4, 6) divides the line segment joining the points A(−6, 10) and B(3, −8) in the ratio 2 : 7.

### Area of a Triangle

If \(A(x_1, y_1), B(x_2, y_2)\) and \(C(x_3, y_3)\) are the vertices of a \(\Delta ABC\), then the area of \(\Delta ABC\) is given by

\[
\text{Area of } \Delta ABC = \frac{1}{2} |x_1(y_2 - y_3) + x_2(y_3 - y_1) + x_3(y_1 - y_2)|
\]

#### Trick to remember the formula

The formula of area of a triangle can be learnt with the help of the following arrow diagram:

\[
\Delta ABC = \frac{1}{2} \left| \begin{array}{ccc}
  x_1 & y_1 \\
  x_2 & y_2 \\
  x_3 & y_3 \\
  x_1 & y_1 
\end{array} \right|
\]
Find the sum of products of numbers at the ends of the lines pointing downwards and then subtract the sum of products of numbers at the ends of the line pointing upwards, multiply the difference by \(\frac{1}{2}\). i.e. \(\text{Area of } \Delta ABC = \frac{1}{2}[(x_1y_2 + x_2y_3 + x_3y_1) - (x_1y_3 + x_2y_1 + x_2y_1)]\)

**IMPORTANT QUESTIONS**

Find the area of a triangle whose vertices are (1, –1), (–4, 6) and (–3, –5).

**Solution:** Here, A(1, –1), B(–4, 6) and C (–3, –5).

Using the formula

\[\Delta ABC = \frac{1}{2} \begin{vmatrix} x_1 & y_1 \\ x_2 & y_2 \\ x_3 & y_3 \end{vmatrix}\]

we get

\[\Delta ABC = \frac{1}{2} \begin{vmatrix} 1 & -1 \\ -4 & 6 \\ -3 & -5 \end{vmatrix}\]

\[\Delta ABC = \frac{1}{2} [(6 + 20 + 3) - (-5 - 18 + 4)] = \frac{1}{2} [29 - (-19)] = \frac{1}{2} (29 + 19) = \frac{1}{2} \times 48 = 24 \text{ sq. units}\]

So, the area of the triangle is 24 square units.

CIRCLES

THEOREMS
1) The tangent to a circle is perpendicular to the radius through the point of contact.
2) The lengths of tangents drawn from an external point to a circle are equal.

Given: A circle C (O, r) and two tangents say PQ and PR from an external point P.
To prove: PQ = PR.

Construction: Join OQ, OR and OP.
Proof: In ΔOQP and ΔORP
\[ OQ = OR \quad \text{(radii of the same circle)} \]
\[ OP = OP \quad \text{(Common)} \]
\[ \angle Q = \angle R = \text{each } 90^\circ \text{ (The tangent at any point of a circle is perpendicular to the radius through the point of contact)} \]
Hence ΔOQP ≅ ΔORP \hspace{1cm} \text{(By RHS Criterion)}
\[ \therefore \quad PQ = PR \quad \text{(By CPCT)} \]

Hence Proved.

Solution:

<table>
<thead>
<tr>
<th>Literacy rate (in %)</th>

<th>Class mark ‘x’</th>
<th>( u = \frac{x - A}{h} )</th>
<th>( fu )</th>
</tr>

</tbody>
</table>

Here, \( \sum fu = -2, \sum f = 35 \), \( A = 70, h = 10 \)

Mean, \( \bar{x} = A + \frac{\sum f_i u_i}{f} \times h \) \( = \Rightarrow \bar{x} = 70 + \frac{-2}{35} \times 10 = 70 - \frac{20}{35} = 70 - \frac{4}{7} = 70 - 0.57 \Rightarrow \bar{x} = 69.43 \)

MODE OF GROUPED DATA

\[ Mode = l + \left( \frac{f_1 - f_0}{2f_1 - f_0 - f_2} \right) \times h \]

where \( l \) = lower limit of the modal class,
\( h \) = size of the class interval (assuming all class sizes to be equal),
\( f_1 \) = frequency of the modal class,
\( f_0 \) = frequency of the class preceding the modal class,
\( f_2 \) = frequency of the class succeeding the modal class.

**IMPORTANT QUESTIONS**

Find the mean, mode and median for the following frequency distribution.

<table>
<thead>
<tr>
<th>Class (in Rs.)</th>
<th>0-10</th>
<th>10-20</th>
<th>20-30</th>
<th>30-40</th>
<th>40-50</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>8</td>
<td>16</td>
<td>36</td>
<td>34</td>
<td>6</td>
<td>100</td>
</tr>
</tbody>
</table>

**Solution:**

Here, highest frequency is 36 which belongs to class 20 – 30. So, modal class is 20 – 30,
\( l = 20, f_0 = 16, f_1 = 36, f_2 = 34, h = 10 \)

We know that \( Mode = l + \left( \frac{f_1 - f_0}{2f_1 - f_0 - f_2} \right) \times h \)

\[ \Rightarrow Mode = 20 + \frac{36 - 16}{2(36) - 16 - 34} \times 10 \]

\[ \Rightarrow Mode = 20 + \frac{20}{72 - 50} \times 10 = 20 + \frac{200}{22} = 20 + 9.09 = 29.09 \]

<tbody>
<tr>

**IMPORTANT QUESTIONS**

Find the median of the following frequency distribution:

<table>
<thead>
<tr>
<th>Class</th>
<th>75-84</th>
<th>85-94</th>
<th>95-104</th>
<th>105-114</th>
<th>115-124</th>
<th>125-134</th>
<th>135-144</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>8</td>
<td>11</td>
<td>26</td>
<td>31</td>
<td>18</td>
<td>4</td>
<td>2</td>
</tr>
</tbody>
</table>

Solution:

<table>
<thead>
<tr>
<th>Class</th>
<th>True Class limits</th>
<th>Frequency</th>
<th>cf</th>
</tr>
</thead>
<tbody>
<tr>
<td>75-84</td>
<td>74.5 – 84.5</td>
<td>8</td>
<td>8</td>
</tr>
<tr>
<td>85-94</td>
<td>84.5 – 94.5</td>
<td>11</td>
<td>19</td>
</tr>
<tr>
<td>95-104</td>
<td>94.5 – 104.5</td>
<td>26</td>
<td>45</td>
</tr>
<tr>
<td>105-114</td>
<td>104.5 – 114.5</td>
<td>31</td>
<td>76</td>
</tr>
<tr>
<td>115-124</td>
<td>114.5 – 124.5</td>
<td>18</td>
<td>94</td>
</tr>
<tr>
<td>125-134</td>
<td>124.5 – 134.5</td>
<td>4</td>
<td>98</td>
</tr>
<tr>
<td>135-144</td>
<td>134.5 – 144.5</td>
<td>2</td>
<td>100</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td></td>
<td><strong>100</strong></td>
<td></td>
</tr>
</tbody>
</table>

Here, \( n = 100 \Rightarrow \frac{n}{2} = 50 \) which belongs to 104.5 – 114.5

So, \( l = 104.5, cf = 45, f = 31, h = 10 \)

We know that \( \text{Median} = l + \left( \frac{n}{2} - cf \right) \times h \times \frac{f}{f} \)

\[
\Rightarrow \text{Median} = 104.5 + \frac{50 - 45}{31} \times 10 \Rightarrow \text{Median} = 104.5 + \frac{50}{31} = 104.5 + 1.61 = 106.11
\]

CUMULATIVE FREQUENCY CURVE IS ALSO KNOWN AS ‘OGIVE’.
There are three methods of drawing ogive:

1. **LESS THAN METHOD**

   **Steps involved in calculating median using less than Ogive approach:**
   - Convert the series into a 'less than ' cumulative frequency distribution.
   - Let N be the total number of students who's data is given. N will also be the cumulative frequency of the last interval. Find the (N/2)th item and mark it on the y-axis.
   - Draw a perpendicular from that point to the right to cut the Ogive curve at point A.
   - From point A where the Ogive curve is cut, draw a perpendicular on the x-axis. The point at which it touches the x-axis will be the median value of the series as shown in the graph.
2. MORE THAN METHOD

Steps involved in calculating median using more than Ogive approach-

- Convert the series into a 'more than' cumulative frequency distribution.
- Let N be the total number of students who's data is given. N will also be the cumulative frequency of the last interval. Find the \( \frac{N}{2} \)th item and mark it on the y-axis.
- Draw a perpendicular from that point to the right to cut the Ogive curve at point A.
- From point A where the Ogive curve is cut, draw a perpendicular on the x-axis. The point at which it touches the x-axis will be the median value of the series as shown in the graph.

3. LESS THAN AND MORE THAN OGIVE METHOD

Another way of graphical determination of median is through simultaneous graphic presentation of both the less than and more than Ogives.

- Mark the point A where the Ogive curves cut each other.
- Draw a perpendicular from A on the x-axis. The corresponding value on the x-axis would be the median value.
The median of grouped data can be obtained graphically as the \( x \)-coordinate of the point of intersection of the two ogives for this data.

**IMPORTANT QUESTIONS**

The following distribution gives the daily income of 50 workers of a factory.

<table>
<thead>
<tr>
<th>Daily income (in Rs)</th>
<th>100 – 120</th>
<th>120 – 140</th>

<th>160 – 180</th>
<th>180 – 200</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of workers</td>

</table>

Convert the distribution above to a less than type cumulative frequency distribution, and draw its ogive.

**Solution:**

CHAPTER – 15
PROBABILITY

The theoretical probability (also called classical probability) of an event A, written as \( P(A) \), is defined as
\[
P(A) = \frac{\text{Number of outcomes favourable to } A}{\text{Number of all possible outcomes of the experiment}}
\]

COMPLIMENTARY EVENTS AND PROBABILITY

We denote the event 'not E' by \( \overline{E} \). This is called the complement event of event E.

So, \( P(E) + P(\overline{E}) = 1 \)
i.e., \( P(E) + P(\overline{E}) = 1 \), which gives us \( P(\overline{E}) = 1 - P(E) \).

The probability of an event which is impossible to occur is 0. Such an event is called an impossible event.

The probability of an event which is sure (or certain) to occur is 1. Such an event is called a sure event or a certain event.

The probability of an event E is a number \( P(E) \) such that \( 0 \leq P(E) \leq 1 \)

An event having only one outcome is called an elementary event. The sum of the probabilities of all the elementary events of an experiment is 1.

DECK OF CARDS AND PROBABILITY

A deck of playing cards consists of 52 cards which are divided into 4 suits of 13 cards each. They are black spades (♠) red hearts (♥), red diamonds (♦) and black clubs (♣).

The cards in each suit are Ace, King, Queen, Jack, 10, 9, 8, 7, 6, 5, 4, 3 and 2. Kings, Queens and Jacks are called face cards.

IMPORTANT QUESTIONS

Two dice are thrown together. Find the probability that the sum of the numbers on the top of the dice is (i) 9 (ii) 10

Solution:
Here, total number of outcomes, n(s) = 36
(i) Let A be the event of getting the sum of the numbers on the top of the dice is 9 then we have n(A) = 4 i.e. (3, 6), (4, 5), (5, 4), (6, 3)

Therefore, Probability of getting the sum of the numbers on the top of the dice is 9, \( P(A) = \frac{n(A)}{n(S)} \)
\[ \Rightarrow P(A) = \frac{4}{36} = \frac{1}{9} \]

(ii) Let B be the event of getting the sum of the numbers on the top of the dice is 10 then we have n(B) = 3 i.e. (4, 6), (5, 5), (6, 4)

Therefore, Probability of getting the sum of the numbers on the top of the dice is 10, \( P(B) = \frac{n(B)}{n(S)} \)
\[ \Rightarrow P(B) = \frac{3}{36} = \frac{1}{12} \]

One card is drawn from a well-shuffled deck of 52 cards. Find the probability of getting (i) red colour ace card (ii) a face card or a spade card (iii) a black face card

Solution:
Here, total number of outcomes, n(s) = 52
(i) Let A be the event of getting red colour ace card and we know that the number of red ace card is 2 then we have, n(A) = 2

Therefore, Probability of getting red colour ace card, \( P(A) = \frac{n(A)}{n(S)} \)
\[ \Rightarrow P(A) = \frac{2}{52} = \frac{1}{26} \]

(ii) Let B be the event of getting a face card or a spade card and we know that there are 12 face cards, 13 spade cards and 3 face cards are spade then we have, n(B) = 12 + 13 – 3 = 22

Therefore, Probability of getting a face card or a spade card, \( P(B) = \frac{n(B)}{n(S)} \)
\[ \Rightarrow P(B) = \frac{22}{52} = \frac{11}{26} \]

(iii) Let B be the event of getting a black face card and we know that there are 6 face cards are black then we have, n(C) = 6

Therefore, Probability of getting a black face card, \( P(C) = \frac{n(C)}{n(S)} \)
\[ \Rightarrow P(C) = \frac{6}{52} = \frac{3}{26} \]

**GRAPHICAL METHOD OF SOLUTION OF A PAIR OF LINEAR EQUATIONS**

The graph of a pair of linear equations in two variables is represented by two lines.

1. If the lines intersect at a point, then that point gives the unique solution of the two equations. In this case, the pair of equations is **consistent**.

2. If the lines coincide, then there are infinitely many solutions — each point on the line being a solution. In this case, the pair of equations is **dependent (consistent)**.
3. If the lines are parallel, then the pair of equations has no solution. In this case, the pair of equations is inconsistent.

**IMPORTANT QUESTIONS**

Solve the equation graphically: \( x + 3y = 6 \) and \( 2x - 3y = 12 \).

**Solution:** Given that

\[ x + 3y = 6 \Rightarrow 3y = 6 - x \Rightarrow y = \frac{6 - x}{3} \]

| \( x \) | 0 | 3 | 6 |
| \( y \) | 2 | 1 | 0 |

and \( 2x - 3y = 12 \Rightarrow 3y = 2x - 12 \Rightarrow y = \frac{2x - 12}{3} \)

| \( x \) | 0 | 3 | 6 |
| \( y \) | -4 | -2 | 0 |

Now plot the points and join the points to form the lines AB and PQ as shown in graph.

Since point B(6, 0) common to both the lines AB and PQ. Therefore, the solution of the pair of linear equations is \( x = 6 \) and \( y = 0 \)

CHAPTER – 4
QUADRATIC EQUATIONS

FACTORISATION METHODS TO FIND THE SOLUTION OF QUADRATIC EQUATIONS
Steps to find the solution of given quadratic equation by factorisation
➢ Firstly, write the given quadratic equation in standard form \( ax^2 + bx + c = 0 \).
➢ Find two numbers \( \alpha \) and \( \beta \) such that sum of \( \alpha \) and \( \beta \) is equal to \( b \) and product of \( \alpha \) and \( \beta \) is equal to \( ac \).
➢ Write the middle term \( bx \) as \( ax + \beta x \) and factorise it by splitting the middle term and let factors are \( (x + p) \) and \( (x + q) \) i.e. \( ax^2 + bx + c = 0 \Rightarrow (x + p)(x + q) = 0 \)
➢ Now equate each factor to zero and find the values of \( x \).
➢ These values of \( x \) are the required roots/solutions of the given quadratic equation.

IMPORTANT QUESTIONS

Solution: \( x^2 + 2x - 8 = 0 \)
\[ \Rightarrow x^2 + 4x - 2x - 8 = 0 \Rightarrow (x+4)(x-2) = 0 \]
\[ \Rightarrow x + 4 = 0, x - 2 = 0 \Rightarrow x = -4, 2 \]

8. Solve the following for \( x \):
\[ \frac{1}{2a+b+2x} = \frac{1}{2a} + \frac{1}{b} + \frac{1}{2x} \]

NATURE OF ROOTS
The roots of the quadratic equation \( ax^2 + bx + c = 0 \) by quadratic formula are given by
\[ x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} = \frac{-b \pm \sqrt{D}}{2a} \]
where \( D = b^2 - 4ac \) is called discriminant. The nature of roots depends upon the value of discriminant \( D \). There are three cases –
Case – I
When \( D > 0 \) i.e. \( b^2 - 4ac > 0 \), then the quadratic equation has two distinct roots.
\[ \text{i.e. } x = \frac{-b + \sqrt{D}}{2a} \text{ and } x = \frac{-b - \sqrt{D}}{2a} \]
Case – II
When \( D = 0 \), then the quadratic equation has two equal real roots.
\[ \text{i.e. } x = \frac{-b}{2a} \text{ and } x = \frac{-b}{2a} \]
Case – III
When \( D < 0 \) then there is no real roots exist.
IMPORTANT QUESTIONS
Find the discriminant of the quadratic equation \(2x^2 - 4x + 3 = 0\), and hence find the nature of its roots.

**Solution**: The given equation is of the form \(ax^2 + bx + c = 0\), where \(a = 2\), \(b = -4\) and \(c = 3\).

Therefore, the discriminant, \(D = b^2 - 4ac = (-4)^2 - (4 \times 2 \times 3) = 16 - 24 = -8 < 0\)

So, the given equation has no real roots.

**Questions for Practice**

9. If \(ax^2 + bx + c = 0\) has equal roots, what is the value of \(c\)?

**QUADRATIC FORMULA METHOD**
Steps to find the solution of given quadratic equation by quadratic formula method:
- Firstly, write the given quadratic equation in standard form \(ax^2 + bx + c = 0\).
- Write the values of \(a\), \(b\) and \(c\) by comparing the given equation with standard form.
- Find discriminant \(D = b^2 - 4ac\). If value of \(D\) is negative, then there is no real solution i.e. solution does not exist. If value of \(D \geq 0\), then solution exists follow the next step.
- Put the value of \(a\), \(b\) and \(D\) in quadratic formula \(x = \frac{-b \pm \sqrt{D}}{2a}\) and get the required roots/solutions.

**IMPORTANT QUESTIONS**
Solve the quadratic equation by using quadratic formula: \(x^2 + x - 6 = 0\)

**Solution**: Here, \(a = 1\), \(b = 1\), \(c = -6\)

\(\Rightarrow D = b^2 - 4ac = 1 - 4(1)(-6) = 1 + 24 = 25 > 0\)

Now, \(x = \frac{-b \pm \sqrt{D}}{2a} = \frac{-1 \pm \sqrt{25}}{2(1)} = \frac{-1 \pm 5}{2} \Rightarrow x = \frac{-1 - 5}{2} or \frac{-1 + 5}{2} \Rightarrow x = -3 or 2\)

**WORD PROBLEMS**

**IMPORTANT QUESTIONS**
A motor boat whose speed is 18 km/h in still water takes 1 hr. more to go 24 km upstream than to return downstream to the same spot. Find the speed of stream.

**Solution**: Let the speed of the stream be \(x\) km/h.

Therefore, the speed of the boat upstream = \((18 - x)\) km/h and the speed of the boat downstream = \((18 + x)\) km/h.

Prepared by: M. S. KumarSwamy, TGT(Maths)
The time taken to go upstream = \[ \frac{\text{distance}}{\text{speed}} = \frac{24}{18-x} \]

Similarly, the time taken to go downstream = \[ \frac{24}{18+x} \]

According to the question, \[ \frac{24}{18-x} - \frac{24}{18+x} = 1 \]

\[ \Rightarrow 24(18 + x) - 24(18 - x) = (18 - x)(18 + x) \]

\[ \Rightarrow x^2 + 48x - 324 = 0 \]

\[ \Rightarrow (x - 6)(x + 54) = 0 \] (using factorisation)

\[ \Rightarrow x = 6, -54 \]

Since \( x \) is the speed of the stream, it cannot be negative. So, we ignore the root \( x = -54 \). Therefore, \( x = 6 \) gives the speed of the stream as 6 km/h.

CHAPTER – 8 & 9
TRIGONOMETRY

Trigonometric Ratios (T - Ratios) of an acute angle of a right triangle

In XOY-plane, let a revolving line OP starting from OX, trace out \( \angle XOP = \theta \). From P \((x, y)\) draw PM \perp OX.

In right angled triangle OMP. OM = \( x \) (Adjacent side); PM = \( y \) (opposite side); OP = \( r \) (hypotenuse).

\[
\begin{align*}
\sin \theta &= \frac{\text{Opposite Side}}{\text{Hypotenuse}} = \frac{y}{r}, & \cos \theta &= \frac{\text{Adjacent Side}}{\text{Hypotenuse}} = \frac{x}{r}, & \tan \theta &= \frac{\text{Opposite Side}}{\text{Adjacent Side}} = \frac{y}{x} \\
\sec \theta &= \frac{1}{\cos \theta}, & \csc \theta &= \frac{1}{\sin \theta}, & \cot \theta &= \frac{1}{\tan \theta}
\end{align*}
\]

Reciprocal Relations

Quotient Relations

\[
\tan \theta = \frac{\sin \theta}{\cos \theta} \quad \text{and} \quad \cot \theta = \frac{\cos \theta}{\sin \theta}
\]

IMPORTANT QUESTIONS

If \( \tan A = \frac{4}{3} \), find the value of all T-ratios of \( \theta \).

Solution: Given that, In right \( \triangle ABC \), \( \tan A = \frac{BC}{AB} = \frac{4}{3} \)

Therefore, if BC = 4k, then AB = 3k, where k is a positive number.

Now, by using the Pythagoras Theorem, we have

\[
AC^2 = AB^2 + BC^2 = (4k)^2 + (3k)^2 = 25k^2
\]

So, AC = 5k

Now, we can write all the trigonometric ratios using their definitions:

\[
\begin{align*}
\sin A &= \frac{BC}{AC} = \frac{4k}{5k} = \frac{4}{5}, & \cos A &= \frac{AB}{AC} = \frac{3k}{5k} = \frac{3}{5} \\
\tan A &= \frac{1}{\cos A} = \frac{3}{4}, & \cot A &= \frac{1}{\tan A} = \frac{4}{3}, \quad \text{and} \quad \csc A = \frac{1}{\sin A} = \frac{5}{4}
\end{align*}
\]

IMPORTANT QUESTIONS

If \( \cos (A - B) = \frac{\sqrt{3}}{2} \) and \( \sin (A + B) = 1 \), then find the value of \( A \) and \( B \).

Solution: Given that \( \cos(A - B) = \frac{\sqrt{3}}{2} = \cos 30^\circ \)

\( A - B = 30^\circ \) .................. (1)

and \( \sin(A + B) = 1 = \sin 90^\circ \)

\( A + B = 90^\circ \) .................. (2)
Solving equations (1) and (2), we get \( A = 60^\circ \) and \( B = 30^\circ \).

**Questions for Practice**

**Evaluate each of the following:**

1. \( \sin 60^\circ \cos 30^\circ + \cos 60^\circ \sin 30^\circ \)
2. \( \cos 60^\circ \cos 30^\circ - \sin 60^\circ \sin 30^\circ \)
3. \( \cos 45^\circ \cos 30^\circ + \sin 45^\circ \sin 30^\circ \)
4. \( \sin 60^\circ \sin 45^\circ - \cos 60^\circ \cos 45^\circ \)
5. \( \sin^2 30^\circ + 4 \cot^2 45^\circ - \sec^2 60^\circ \cos e 2.5^\circ \cdot \sec^2 30^\circ \)
6. If \( \sin (A - B) = \frac{1}{2} \) and \( \cos (A + B) = \frac{1}{2} \), then find the value of \( A \) and \( B \).
7. If \( \tan (A - B) = \frac{1}{\sqrt{3}} \) and \( \tan (A + B) = \sqrt{3} \), then find the value of \( A \) and \( B \).

**Trigonometric ratios of Complementary angles.**

\[
\begin{align*}
\sin (90^\circ - \theta) &= \cos \theta \\
\cos (90^\circ - \theta) &= \sin \theta \\
\tan (90^\circ - \theta) &= \cot \theta \\
\cot (90^\circ - \theta) &= \tan \theta \\
\sec (90^\circ - \theta) &= \cosec \theta \\
\cosec (90^\circ - \theta) &= \sec \theta.
\end{align*}
\]

**IMPORTANT QUESTIONS**

If \( \sin 3A = \cos (A - 26^\circ) \), where \( 3A \) is an acute angle, find the value of \( A \).

**Solution:** Given that \( \sin 3A = \cos (A - 26^\circ) \). (1)

Since \( \sin 3A = \cos (90^\circ - 3A) \), we can write (1) as

\[ \cos (90^\circ - 3A) = \cos (A - 26^\circ) \]

Since \( 90^\circ - 3A \) and \( A - 26^\circ \) are both acute angles, therefore comparing both sides we get,

\[ 90^\circ - 3A = A - 26^\circ \]

which gives \( A = 29^\circ \)

**Questions for Practice**

1. Express \( \cot 85^\circ + \cos 75^\circ \) in terms of trigonometric ratios of angles between 0° and 45°.
2. Express \( \sin 67^\circ + \cos 75^\circ \) in terms of trigonometric ratios of angles between 0° and 45°.
3. If \( \tan 2A = \cot (A - 18^\circ) \), where \( 2A \) is an acute angle, find the value of \( A \).
4. If \( \tan A = \cot B \), prove that \( A + B = 90^\circ \).
5. If \( \sec 4A = \cosec (A - 20^\circ) \), where \( 4A \) is an acute angle, find the value of \( A \).
6. If \( A, B \) and \( C \) are interior angles of a triangle \( ABC \), then show that

**TRIGONOMETRIC IDENTITIES**

An equation involving trigonometric ratios of an angle is said to be a trigonometric identity if it is satisfied for all values of \( \theta \) for which the given trigonometric ratios are defined.

**Identity (1):** \( \sin^2 \theta + \cos^2 \theta = 1 \)

\[ \Rightarrow \sin^2 \theta = 1 - \cos^2 \theta \] and \( \cos^2 \theta = 1 - \sin^2 \theta \).

**Identity (2):** \( \sec^2 \theta = 1 + \tan^2 \theta \)

\[ \Rightarrow \sec^2 \theta - \tan^2 \theta = 1 \] and \( \tan^2 \theta = \sec^2 \theta - 1 \).

**Identity (3):** \( \cosec^2 \theta = 1 + \cot^2 \theta \)

\[ \Rightarrow \cosec^2 \theta - \cot^2 \theta = 1 \] and \( \cot^2 \theta = \cosec^2 \theta - 1 \).

**IMPORTANT QUESTIONS**

Prove that: \( \frac{\cos A - \sin A + 1}{\cos A + \sin A - 1} = \cos ec A + \cot A \)
Solution: \[ \text{LHS} = \frac{\cos A - \sin A + 1}{\cos A + \sin A - 1} \]

(Dividing Numerator and Denominator by \(\sin A\), we get)

\[ \frac{\cos A - \sin A + 1}{\cos A + \sin A - 1} = \frac{\cot A - 1 + \cos ec A}{\cot A + 1 - \cos ec A} \]

\[ \therefore \cot A = \frac{\cos A}{\sin A}, \cos ec A = \frac{1}{\sin A} \]

\[ \cot A + \cos ec A - 1 = \frac{\cot A + \cos ec A - (\cos ec^2 A - \cot^2 A)}{\cot A + 1 - \cos ec A} \]

\[ = \frac{\cot A + \cos ec A - \cos ec A - \cot A(\cos ec A - \cot A)}{\cot A + 1 - \cos ec A} \]

\[ = \frac{(\cos ec A + \cot A)(1 - \cos ec A + \cot A)}{\cot A + 1 - \cos ec A} = \cos ec A + \cot A = \text{RHS} \]

Questions for Practice
Prove the following identities:
1. \(\sec A (1 - \sin A)(\sec A + \tan A) = 1\).
2. \(\cot A - \cos A \quad \cos ec A - 1\)
3. \(\cot A + \cos A \quad \cos ec A + 1\)
4. \(\sin \theta - \cos \theta + 1 \quad \frac{1}{\sin \theta - \tan \theta}\)
5. \(\cos ec \theta - \cot \theta)^2 = \frac{1 - \cos \theta}{1 + \cos \theta}\)
6. \(\frac{\cos A + 1 + \sin A}{\tan \theta + \cot \theta} = 2 \sec A\)
7. \(\frac{1 + \sec A}{\sec A} = \frac{\sin^2 A}{1 - \cos A}\)
8. \(\frac{1 + \sin A}{\sqrt{1 - \sin A}} = \sec A + \tan A\)
9. \(\frac{\sin \theta - 2 \sin^3 \theta}{2 \cos^3 \theta - \cos \theta} = \tan \theta\)
10. \((\sin A + \cosec A)^2 + (\cos A + \sec A)^2 = 7 + \tan^2 A + \cot^2 A\)
11. \((\cos ec A - \sin A)(\sec A - \cos A) = \frac{1}{\tan A + \cot A}\)
12. \(\frac{1 + \tan^2 A}{1 + \cot^2 A} = \frac{(1 - \tan A)^2}{1 - \cot A} = \tan^2 A\)

** ANGLE OF ELEVATION **
In the below figure, the line AC drawn from the eye of the student to the top of the minar is called the line of sight. The student is looking at the top of the minar. The angle BAC, so formed by the line of sight with the horizon, is called the angle of elevation of the top of the minar from the eye of the student. Thus, the line of sight is the line drawn from the eye of an observer to the point in the object viewed by the observer.
The **angle of elevation** of the point viewed is the angle formed by the line of sight with the horizontal when the point being viewed is above the horizontal level, i.e., the case when we raise our head to look at the object.

**ANGLE OF DEPRESSION**

In the below figure, the girl sitting on the balcony is looking down at a flower pot placed on a stair of the temple. In this case, the line of sight is below the horizontal level. The angle so formed by the line of sight with the horizontal is called the **angle of depression**. Thus, the **angle of depression** of a point on the object being viewed is the angle formed by the line of sight with the horizontal when the point is below the horizontal level, i.e., the case when we lower our head to look at the point being viewed.

**IMPORTANT QUESTIONS**

The angles of depression of the top and the bottom of an 8 m tall building from the top of a multi-storeyed building are 30° and 45°, respectively. Find the height of the multi-storeyed building and the distance between the two buildings.

**Solution**:

Let $PC = h \text{ m}$ be the height of multi-storeyed building and $AB$ denotes the 8 m tall building. 

$BD = AC = x \text{ m}, PC = h = PD + DC = PD + AB = PD + 8 \text{ m}$

So, $PD = h - 8 \text{ m}$

Now, $\angle QPB = \angle PBD = 30^\circ$

Similarly, $\angle QPA = \angle PAC = 45^\circ$.

In right $\triangle PBD$, $\tan 30^\circ = \frac{PD}{BD} \Rightarrow \frac{1}{\sqrt{3}} = \frac{h-8}{x}$

$\Rightarrow x = (h-8)\sqrt{3} \text{ m} \text{ ................. (1)}$
Also, In right Δ PAC, \( \tan 45^\circ = \frac{PC}{AC} \Rightarrow 1 = \frac{h}{x} \)
\( \Rightarrow x = h \text{ m} \) ........................ (2)

From equations (1) and (2), we get \( h = (h-8)\sqrt{3} \)
\( \Rightarrow h\sqrt{3} - 8\sqrt{3} = h\sqrt{3} - h = 8\sqrt{3} \)
\( \Rightarrow h(\sqrt{3}-1) = 8\sqrt{3} \Rightarrow h = \frac{8\sqrt{3}}{\sqrt{3}-1} \)
\( \Rightarrow h = \frac{8\sqrt{3}}{\sqrt{3}-1} \times \frac{\sqrt{3}+1}{\sqrt{3}+1} = \frac{8\sqrt{3}(\sqrt{3}+1)}{3-1} \)
\( \Rightarrow h = \frac{8(3+\sqrt{3})}{2} = 4(3+\sqrt{3}) \text{ m} \)

Hence, the height of the multi-storeyed building is \( 4(3+\sqrt{3}) \text{ m} \) and the distance between the two buildings is also \( 4(3+\sqrt{3}) \text{ m} \).

From a point on a bridge across a river, the angles of depression of the banks on opposite sides of the river are 30° and 45°, respectively. If the bridge is at a height of 3 m from the banks, find the width of the river.

**Solution:** Let A and B represent points on the bank on opposite sides of the river, so that AB is the width of the river. P is a point on the bridge at a height of 3 m, i.e., DP = 3 m.

Now, \( AB = AD + DB \)

In right Δ APD, \( \tan 30^\circ = \frac{PD}{AD} \Rightarrow 1 = \frac{3}{AD} \)
\( \Rightarrow AD = 3\sqrt{3} \text{ m} \)

Also, in right Δ PBD, \( \tan 45^\circ = \frac{PD}{BD} \Rightarrow 1 = \frac{3}{BD} \)
\( \Rightarrow BD = 3 \text{ m} \)

Now, \( AB = BD + AD = 3 + 3\sqrt{3} = 3(1+\sqrt{3}) \text{ m} \)

Therefore, the width of the river is \( 3(1+\sqrt{3}) \text{ m} \)

AREAS RELATED TO CIRCLES

AREA AND PERIMETER OF CIRCLE, QUADRANT, SEMICIRCLE

Area of Circle = \( \pi r^2 \), Perimeter of Circle = Circumference = \( 2\pi r \)

Area of Semicircle = \( \frac{1}{2} \pi r^2 \), Perimeter of Semicircle = \( \pi r + 2r \)

Area of Quadrant = \( \frac{1}{4} \pi r^2 \), Perimeter of Quadrant = \( \frac{1}{2} \pi r + 2r \)

IMPORTANT QUESTIONS

Find the diameter of the circle whose area is equal to the sum of the areas of the two circles of diameters 20 cm and 48 cm.

Solution: Here, radius \( r_1 \) of first circle = \( 20/2 \) cm = 10 cm
and radius \( r_2 \) of the second circle = \( 48/2 \) cm = 24 cm
Therefore, sum of their areas = \( \pi r_1^2 + \pi r_2^2 = \pi (10)^2 + \pi (24)^2 = \pi \times 676 \)
Let the radius of the new circle be \( r \) cm. Its area = \( \pi r^2 \)
Therefore, \( \pi r^2 = \pi \times 676 \Rightarrow r^2 = 676 \Rightarrow r = 26 \)
Thus, radius of the new circle = 26 cm
Hence, diameter of the new circle = \( 2 \times 26 \) cm = 52 cm

Questions for Practice
1. The radii of two circles are 19 cm and 9 cm respectively. Find the radius of the circle which has circumference equal to the sum of the circumferences of the two circles.

AREAS OF SECTOR AND SEGMENT OF A CIRCLE

Area of the sector of angle \( \theta = \frac{\theta}{360^\circ} \times \pi r^2 \), where \( r \) is the radius of the circle and \( \theta \) the angle of the sector in degrees

Length of an arc of a sector of angle \( \theta = \frac{\theta}{360^\circ} \times 2\pi r \), where \( r \) is the radius of the circle and \( \theta \) the angle of the sector in degrees

Area of the segment APB = Area of the sector OAPB – Area of \( \Delta OAB \)

\( \frac{\theta}{360^\circ} \times \pi r^2 – \) area of \( \Delta OAB \)

Area of major sector OAQB = \( \pi r^2 – \) Area of the minor sector OAPB

Area of major segment AQB = \( \pi r^2 – \) Area of the minor segment APB

Area of segment of a circle = Area of the corresponding sector – Area of the corresponding triangle

IMPORTANT QUESTIONS
Find the area of the sector of a circle with radius 4 cm and of angle $30^\circ$. Also, find the area of the corresponding major sector (Use $\pi = 3.14$).

**Solution:** Here, radius, $r = 4$ cm, $\theta = 30^\circ$.

We know that Area of sector = $\frac{\theta}{360^\circ} \times \pi r^2 = \frac{30^\circ}{360^\circ} \times 3.14 \times 4 \times 4 = \frac{1}{12} \times 3.14 \times 4 \times 4$

$= \frac{12.56}{3} = 4.19 \text{ cm}^2$ (approx.)

Area of the corresponding major sector

$= \pi r^2 - \text{area of sector OAPB}$

$= (3.14 \times 16 - 4.19) \text{ cm}^2$

$= 46.05 \text{ cm}^2 = 46.1 \text{ cm}^2$ (approx.)

A chord of a circle of radius 10 cm subtends a right angle at the centre. Find the area of the corresponding:

(i) minor segment (ii) major sector. (Use $\pi = 3.14$)

**Solutions:** Here, radius, $r = 10$ cm, $\theta = 90^\circ$.

We know that Area of minor sector = $\frac{\theta}{360^\circ} \times \pi r^2 = \frac{90^\circ}{360^\circ} \times 3.14 \times 10 \times 10 = \frac{1}{4} \times 314 = 78.5 \text{ cm}^2$

and Area of triangle AOB = $\frac{1}{2} \times b \times h = \frac{1}{2} \times 10 \times 10 = 50 \text{ cm}^2$

Area of minor segment = Area of minor sector – Area of triangle AOB = 78.5 – 50 = 28.5 $\text{ cm}^2$.

Area of circle = $\pi r^2 = 3.14 \times 10 \times 10 = 314 \text{ cm}^2$

Area of major sector = Area of circle – Area of minor sector = 314 – 78.5 = 235.5 $\text{ cm}^2$

**AREA OF SHADED REGION BASED QUESTIONS**

**IMPORTANT QUESTIONS**

In the adjoining figure, two circular flower beds have been shown on two sides of a square lawn ABCD of side 56 m. If the centre of each circular flower bed is the point of intersection O of the diagonals of the square lawn, find the sum of the areas of the lawn and the flower beds.

**Solution:** Here, side of square ABCD, \( a = 56 \) m

diagonal of square = \( a\sqrt{2} = 56\sqrt{2} \)

radius, \( r = OA = OB = OC = OD = \frac{56\sqrt{2}}{2} = 28\sqrt{2} \) cm

Now, Area of sector OAB = Area of sector ODC

\[
\frac{\theta}{360°} \times \pi r^2 = \frac{90°}{360°} \times \frac{22}{7} \times r^2 = \frac{1}{4} \times \frac{22}{7} \times r^2
\]

and Area of \( \Delta OAD = \text{Area of} \ \Delta OBC = \frac{1}{2} \times r \times r = \frac{1}{2} \times r^2 \)

Total area = Area of sector OAB + Area of sector ODC + Area of \( \Delta OAD + \text{Area of} \ \Delta OBC \)

\[
= \frac{1}{4} \times \frac{22}{7} \times r^2 + \frac{1}{4} \times \frac{22}{7} \times r^2 + \frac{1}{2} \times r^2 + \frac{1}{2} \times r^2
\]

\[
= 2 \times \frac{1}{4} \times \frac{22}{7} \times r^2 + 2 \times \frac{1}{2} \times r^2 = \frac{11}{7} \times r^2 + r^2 = \left( \frac{11}{7} + 1 \right) r^2
\]
\[ \frac{18}{7} \times 28 \times 28 \times 2 = 4032 \text{cm}^2 \]

COMBINATIONAL FIGURE BASED QUESTIONS

IMPORTANT QUESTIONS

The decorative block is shown in below left figure made of two solids — a cube and a hemisphere. The base of the block is a cube with edge 5 cm, and the hemisphere fixed on the top has a diameter of 4.2 cm. Find the total surface area of the block.

Solution: The total surface area of the cube = $6 \times (edge)^2 = 6 \times 5 \times 5 \text{ cm}^2 = 150 \text{ cm}^2$.

So, the surface area of the block = Total surface area of the cube – base area of hemisphere + CSA of hemisphere

$= 150 - \pi r^2 + 2\pi r^2 = (150 + \pi r^2) \text{ cm}^2$

$= 150 + \left(\frac{22}{7} \times \frac{4.2 \times 4.2}{2}\right) \text{ cm}^2 = 150 + 13.86 \text{ cm}^2 = 163.86 \text{ cm}^2$

Mayank made a bird-bath for his garden in the shape of a cylinder with a hemispherical depression at one end. The height of the cylinder is 1.45 m and its radius is 30 cm. Find the total surface area of the bird-bath.
Solution: Let \( h \) be height of the cylinder, and \( r \) the common radius of the cylinder and hemisphere. (See above right sided figure)

Total surface area of the bird-bath = CSA of cylinder + CSA of hemisphere

\[
= 2\pi rh + 2\pi r (h + r) = 2\times \frac{22}{7} \times 30(145 + 30) = 2\times \frac{22}{7} \times 30 \times 175 = 33000 \text{ cm}^2 = 3.3 \text{ m}^2
\]

A juice seller was serving his customers using glasses as shown in below figure. The inner diameter of the cylindrical glass was 5 cm, but the bottom of the glass had a hemispherical raised portion which reduced the capacity of the glass. If the height of a glass was 10 cm, find the apparent capacity of the glass and its actual capacity. (Use \( \pi = 3.14 \).)

Solution: Here, inner diameter = 5 cm, height, \( h = 10 \text{ cm} \)

So, radius, \( r = \frac{5}{2} \text{ cm} \)

Apparent capacity of the glass = Volume of cylinder – Volume of hemisphere

\[
= \pi r^2 h - \frac{2}{3} \pi r^3 = \pi r^2 \left( h - \frac{2}{3} r \right) = 3.14 \times \frac{5}{2} \times \frac{5}{2} \times \left( 10 - \frac{2}{3} \times \frac{5}{2} \right)
\]

\[
= 3.14 \times \frac{25}{4} \times \frac{25}{3} = \frac{19625}{12} = 163.54 \text{ cm}^3

CONVERSION BASED QUESTIONS

IMPORTANT QUESTIONS

A cone of height 24 cm and radius of base 6 cm is made up of modelling clay. A child reshapes it in the form of a sphere. Find the radius of the sphere.

**Solution:** Here, radius of cone, \( r = 6 \) cm, height of cone, \( h = 24 \) cm
Let the radius of the sphere be \( R \) cm, then we have

\[
\frac{4}{3} \pi R^3 = \frac{1}{3} \pi r^2 h \Rightarrow 4R^3 = r^2h \Rightarrow R^3 = \frac{r^2h}{4} = \frac{6 \times 6 \times 24}{4} = 6 \times 6 \times 6 \Rightarrow R = 6 \text{ cm}
\]

Therefore, the radius of the sphere is 6 cm.

FRUSTUM OF A CONE BASED QUESTIONS

IMPORTANT QUESTIONS

A drinking glass is in the shape of a frustum of a cone of height 14 cm. The diameters of its two circular ends are 4 cm and 2 cm. Find the capacity of the glass.

**Solution:** Here, height of frustum of cone, \( h = 14 \) cm, diameters of its two circular ends are 4 cm and 2 cm
So, radii of its two circular ends are \( R = 2 \) cm and \( r = 1 \) cm

Now, Capacity of the glass = Volume of a frustum of a cone

\[
\frac{\pi h}{3} \left( R^2 + r^2 + Rr \right) = \frac{22}{7} \times \frac{14}{3} \left( 4^2 + 1^2 + 2 \times 1 \right) = \frac{44}{3} \left( 4 + 1 + 2 \right) = \frac{44}{3} \times 7 = \frac{308}{3} = 102.67 \text{ cm}^3
\]

The slant height of a frustum of a cone is 4 cm and the perimeters (circumference) of its circular ends are 18 cm and 6 cm. Find the curved surface area of the frustum.

**Solution:** Here, slant height of a frustum of a cone, \( l = 4 \) cm,
Circumference of upper end = \( 2\pi r = 6 \) cm
So, \( \pi r = 3 \) cm
and Circumference of upper end = \( 2\pi R = 18 \) cm
So, \( \pi R = 9 \) cm

Now, curved surface area of the frustum = \( \pi l(R + r) = 1 \times (\pi R + \pi r) = 4 \times (9 + 3) = 4 \times 12 = 48 \text{ cm}^2 \)
